Kotlin. < Managing User Lists and Asynchronous Handling with Coroutine >

Let's write a Kotlin application to manage a list of users. Each user will have attributes such as: name, age, and email address.

Technical Requirements:

- Construct a User class that represents user information. Define the required properties and methods.
- Build the UserManager class to manage the list of users. This class will have methods to add users, display a list of users, and find users by name.
- Use a lambda to sort the list of users by name.
- Use coroutine to simulate adding a user to a list of users with a random interval. Each time a user is added, generate a random delay from 500ms to 2000ms.

You can use `sortedBy`, along with `ArrayList` to store a list of users. To implement coroutine, use `GlobalScope.launch` and the `delay` function to simulate asynchronous processing.

Estimated Time to complete: 90 min
